

Physiotherapeutic Management of Lumbar Spine Pathology

Authors Rick Jemmett and David MacDonald deliver a rigorously argued, academically-sound and clinically relevant model of assessment, classification and management for patients with lumbar spine pathology. Acknowledging the problems and limitations inherent in the traditional pathoanatomical and biopsychosocial models, the authorsâ€™™ Segmental Dysfunction Model provides for a significantly more predictable approach to patient management while retaining a modern physical therapy skill set. Underpinned by the most recent research from a variety of disciplines, the authors have modeled an evidence-based pathomechanical definition of lumbar dysfunction with management solutions grounded in prospective clinical reasoning, therapeutic motor re-education exercises and updated manual therapy applications. The result is a re-conceptualization of low back pain which allows clinicians to appreciate the nature and extent of their patientâ€™™s dysfunction and provide more consistent and successful patient management.
